AI-DRIVEN SDLC WITH DATABRICKS

Participant Handout

Discussion Cards

Six short discussions. Each one ends with a sentence that you write down.

Audience	Every participant
Course	AI-Driven SDLC with Databricks, four hours, instructor-led
Tools	Azure Databricks with Genie Code, Visual Studio Code with GitHub Copilot
Kit version	2.0, October 7, 2026

> There is no right answer on these cards. There is your answer, and the evidence you have for it.

Course kit version 2.0, built on October 7, 2026, for the four-hour instructor-led workshop. All data in this kit is fictional. Product behavior was read from the vendor documentation on the build date.

How these cards work

Six times today the work stops for a few minutes, and the room talks. Each card holds the questions of one discussion, and room for one sentence. The sentence is yours: you take it back to your desk.

Card	When	Minutes	The discussion
1	At the end of Exercise 1	1	What does "correct" mean?
2	After Lab 1	5	Explain it, then prove it
3	After Lab 2	5	What ran where, and what did it cost?
4	After Lab 3	5	Cause or symptom?
5	After Lab 4	12	Peer review
6	In Module 6	15	Choose, hand off, commit

Every discussion has the same three moves

1. **With your partner.** Agree on your answer to the first question, and decide who speaks. The reviewer of the pair is a good choice: the driver has talked to the assistant for the whole lab.
2. **With the room.** Your instructor asks a few pairs. Listen for an answer that differs from yours. It is the most useful answer in the room.
3. **On your own.** Write the sentence at the bottom of the card. It takes half a minute or less.

Three rules for a good answer

- **Answer from your own run.** A number from your screen, the key of a row, the line of a check. "We saw" is evidence. "It should" is not.
- **Explain it with the chat closed.** If you need the assistant to explain your own change, you have found something to work on. That is a good result of a discussion.
- **"We do not know" is an answer.** It becomes a question for a person who decides: a data owner, a tech lead, a reviewer. No assistant closes it for you.

> **KEY MESSAGE**
> There is no right answer on these cards. There is your answer, and the evidence that you have for it.

Keep the cards. With your six sentences on them, they are the shortest summary of the day that you can have.

Card 1: What does "correct" mean?

Module 1 · the last minute of Exercise 1

You have written a bounded request. Before any code exists, say what you will accept as a result, and what a reviewer will want to see.

With your partner

This is the end of Exercise 1: lines 3 and 4 of its box. Before you say them to the room, cross out every word that an assistant can satisfy without being right: "clean", "valid", "works", "runs".

With the room

1. Finish the sentence: **"A correct result means …"**
2. Finish the sentence: **"A reviewer will ask us for this evidence: …"**
3. Which gap did another pair close that your request leaves open?

> **LISTEN FOR**
> A sentence about rows, not about code: where every delivered row goes, and what must add up. A sentence that begins with "the code runs" is the answer that the demonstration has just taken apart.

WRITE YOUR SENTENCE

Before I accept generated code, I want to see:

NOTES FROM THE ROOM

Card 2: Explain it, then prove it

Module 2 · after Lab 1 · 5 minutes

Your notebook passes seven checks on two datasets. The checks say that the code follows the rules of this lab. They do not say that you can explain it, and a reviewer will ask you, not the assistant.

With your partner

Choose one expression that the assistant wrote for you. Explain it to your partner with the pane closed: what does it return for a NULL, for a credit line, or for a key with two master rows?

With the room

1. Which assumption of the assistant would have cost the most if nobody had corrected it? What told you that it was wrong: the rule sheet, the `FACTS` cell, or a check?
2. Explain your expression. Then name the line of a check that proves what you say.
3. Check C6 names 21 fixture rows that the code of this lab cannot decide yet, and your code accepts 16 of them today. What are these rows: an error, a warning, or something else?

> **LISTEN FOR**
> A pair whose assistant assumed something that yours did not. The same request does not get the same answer twice, so nobody can do the review once for the whole room.

WRITE YOUR SENTENCE

The assumption that I will check first, in my own data:

NOTES FROM THE ROOM

Card 3: What ran where, and what did it cost?

Module 3 · after Lab 2 · 5 minutes

You edited on your workstation, tested there, and ran on Databricks. That is three places and three kinds of proof, and more than one meter was running.

With your partner

Read your checkpoint of step 5 to each other: what ran on the workstation, what ran on Databricks, and the two fingerprints. Are the fingerprints equal? What would it mean if they were not?

With the room

1. What did the code tests on your workstation prove? What can they never prove?
2. `PARITY: ALL COMPARISONS PASS`. What does that line say about your module? What does it not say about the reference?
3. Which change of the assistant did you decline? Which sentence gave you the reason: one of your request, of `AGENTS.md`, or of the rule sheet?
4. Three meters ran in this lab: the usage of the assistant, the compute on Databricks, and your own time. Which of them does a vague request multiply?

> **LISTEN FOR**
> Where Spark ran. Nobody in this room ran Spark on a workstation today, whatever the editor was.

WRITE YOUR SENTENCE

A passing test on my workstation proves: _____

_____

It does not prove: _____

_____

NOTES FROM THE ROOM

Card 4: Cause or symptom?

Module 4 · after Lab 3 · 5 minutes

At the start of the lab the code tests were green, and the run finished without an error. On the training data, 232 delivered rows were in no output. You made three defects visible, and you repaired three causes.

With your partner

Choose one of your three repairs. Say its row of the checkpoint table aloud: what failed before, what passes now, and why the fix corrects the cause.

With the room

1. Which sentence of the contract does your fix follow? What would a fix look like that turns the same line green and corrects nothing?
2. The code tests were green while rows were missing. Which kind of evidence saw the loss? Why can a code test not see it?
3. After the second repair, the fixture run accepts 19 lines, where it accepted 21 before. A correct fix made a headline number smaller. How do you explain that to the person who reads the report?
4. At the end, one test and one check were still skipped. What does a skipped check prove?

> **LISTEN FOR**
> The words "we changed the test", "we filtered them out", and "we made an exception". The first changes the judge. The other two remove the witness.

WRITE YOUR SENTENCE

A fix hides the symptom, and does not correct the cause, when:

NOTES FROM THE ROOM

Card 5: Peer review

Module 5 · after Lab 4 · 12 minutes · two pairs together

A reviewer accepts a change from a person, not from a tool. Your workbook has the plan of the two rounds, the questions, and the five conditions. This card has the rules of the conversation, and what you take away from it.

The rules of the conversation

When you explain	When you review
The chat is closed, and the review note is open. One of you explains the change, the other its evidence. Start with the purpose, in one sentence.	One of you asks about the business rule, the other about the tests. Ask, and then wait. Do not explain their change for them.
Show a run, not a summary: the line of a check, the key of a row, the two fingerprints.	Ask for the row: "Show me the line that proves it."
Name one limit of your change before anybody asks for it.	"The assistant said" is not an answer yet. Ask what the run said.

Two rules hold for both sides. "We do not know" goes into the review note, under remaining risks or under questions for the tech lead. And "needs rework" is a statement about a change, not about a person: say which of the five conditions is open, and what would close it.

After both rounds, on your own

1. Which question could you not answer without the assistant? Where is the answer: in the code, in a run, or with a person?
2. Which of the five conditions was the hardest to show, and why?
3. Which gap did your group close in two minutes, and how?

WRITE YOUR SENTENCE

What I could not explain without the assistant: _____

_____

What I will do about it: _____

_____

Card 6: Choose, hand off, commit

Module 6 · 15 minutes · on your own, with your partner, then with the room

The last quarter of an hour belongs to your own work. You fill in the three forms of "Apply it tomorrow" in your workbook. This card has the questions that your partner asks you about each of them.

Minutes	You	Your partner asks
4	**Choose the tool** for one task that is on your desk this week	"What must the assistant see for this task, and where does that truth live: in the data, or in the project?" Then: "What has to run to prove the result?"
4	**Prepare the handoff**: the evidence, a risk, a question	"I am your reviewer. What would make me send this back?" Then: "Which of these points is yours to decide, and which is not?"
4	**Commit**: one task, one prompt, one check, one reviewer, one date	"How will you know that it worked? What will you measure?"
3	**Close**, with the room	The question of this morning again, and one sentence from the people who want to give one

In each part, write for two minutes. Then each of you has one minute to be asked.

With the room

1. The question of this morning: "The code ran. How did you know that it was right?" Would you answer differently now?
2. One sentence from the bottom of this card: "Tomorrow I will …"

WRITE YOUR SENTENCE

Tomorrow I will: _____

I will know that it worked when: _____

The person who will review it: _____

KEY MESSAGE

An assistant may accelerate the work. The developer must understand and validate the result.
